

Give prettier syntax for existential types.

Make new Java annotations for Java interop.

How does Scala deal with Java's wildcard types?

Translate to Scala:

```
Iterator <?>
```

```
Iterator<? extends Component>
```

Why can existential types be ignored most of the time?

What are singleton objects implemented as?

What does Scala do with Java annotations?

How does Scala get away with not adding
thrown exceptions to method bytecode
signatures?

What does the `javap output public
static {}` mean?

Give two strategies for getting around the existential type no-name problem.

When is scala throws declaration bytecode generated?

Implement a trait in Java.

What makes existential types awkward?
Provide an example.

Give the general syntax of existential types.
