

With `ScalaObject`.

This only provides `$tag`, for pattern matching speed.

`final eq

final ne

final ==

final !=`

`final ==` (forwards to `equals`)

`final !=` (opposite of `==`, guaranteed)

``equals(Any)`

`hashCode()`

`toString()`

`final isInstanceOf[T]`

`final asInstanceOf[t] : T` (cast)`

nothing

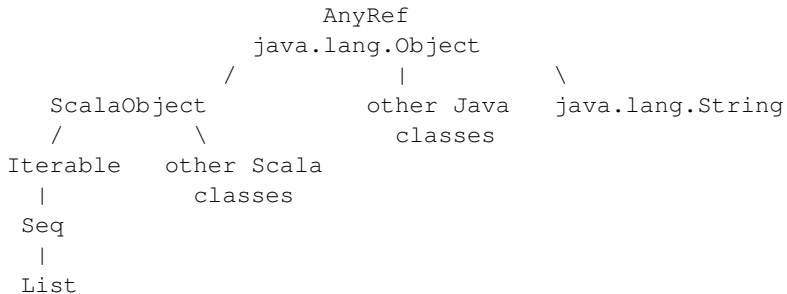

They are declared abstract and final to prevent instantiation with the new keyword.

It has conversion to a rich type in `scala.runtime` that provides more methods.

Any  
/  
AnyVal  
\  
AnyRef  
(on JVM = java.lang.Object)

Any sequence of acceptable characters enclosed by back ticks.

It forces identifier interpretation over keywords or other restrictions.

E.g., `Thread.\yield\()`

### Implicit conversions:

`Char -> Int`

`Byte -> Short -> Int -> Long -> Float -> Double`
