

... not significant.

As in Java, in-line `//` and multiline `/* . . . */`.

Unfortunately, the multiline delimiters can appear in string literals, making commenting out arbitrary blocks of codes unreliable.

There are no integers, or floating point of any size other than 64-bits.

There are no characters either.

`xy` is the same as `x * pow(10, e)`.

As in Python, single or double quote delimiters can be used.

16-bit fixed Unicode is used.
