

How does OCaml support parametric polymorphism?

How are type variables written?

Add type annotations to a function declaration.

How are tuples written?

And their types?

What is *destructuring*?

Demonstrate on tuples.

Access the elements of a tuple.

How are tuples written?

How is the *cons* operator used?

How are parameterized types written?

What is an association list?

How is it queried?

What is *tail recursion*?

Why is it desirable?

List accumulator values in recursive functions
are best built ...
