

Import a module.

What is a *term*?

What are its subdivisions?

Coq commands all end with what?

In Coq scopes are explicitly ...

Open a scope.

Close a scope.

Determine which interpretations are available  
for a notation.

What is a delimiting key?

Give its syntax.

Get everything Coq knows about a scope.

What is the `Check` command used for?

Give its syntax.

Where can decimal notation be used for natural numbers?

Where can decimal notation be used for all integers?

Why can't a `nat` be used as a `z`.

How might this be simulated?

What are the two forms of simple types?
