

`print` in perl doesn't include what?

List the variable type syntax.

What's the difference between double, single quotes, and back ticks?

What are the default values?

How are scalar values interpreted?

What context do double quotes provide?

Assignment to arrays/ hashes?

Create a list using literal syntax.

Unpack that list.

Index an array.

Update an array.

Create a hash using literal syntax.

Look up an element in a hash.

Update a hash.

Describe the Perl noun/verb analogy.

Run some perl straight from the terminal.

Run some perl stored in a file.

Get interpreter warnings.

What is a filehandle?

Which are built in?

Get a filehandle.

What read/write options are available when requesting a new filehandle?

What is a common idiom for handling failure
when opening a file?

Read a line from a file.

Read a line from the terminal.

Write to a file.

Write to the terminal.

What's the difference between `chop` and
`chomp`?

What is Perl's string concatenation operator?

Why does Perl have separate operators for string concatenation and arithmetic addition?

How can you achieve Python's "string multiplication"?

Name three ways to print a formatted string.

What is the exponentiation operator?

Operators ending with = are treated ...

What is the result of assignment?

The auto-incrementing/decrementing operators are just as in ...

What are the two sets of boolean operators?

What's the difference?

What are the standard comparison operators?

What non-standard one is provided?

Name the common file test operators.

What values are truthy?

Why are references truthy and undefined values falsy?

In idiomatic Perl, simple conditionals are achieved with ...

Give the syntax of conditionals.

What's the idiomatic way to accomplish the "if not" control flow?

What are the four looping constructions?

`while's cousin is ...`

Give the canonical `for`-loop iteration construction in Perl.

Describe the `foreach` construction.

What's the huge surprise?

Perl doesn't have `break/continue`, but has
what?

`next/last` can optionally specify what?

If an operator can produce either a list or a scalar, which will be returned?
