

How can you load files in `ghci`?

What is the key restriction of `ghci`?

How can you use a function in infix style?

How can you convert an integral type into a floating type?

And vice-versa?

What's the difference between `/` and `div`?

What is otherwise?

How are lists implemented?

Why is it okay to write many small functions that transform whole data structures and then combine them?
