

How can you use both mutable and immutable Sets in the same file?

Describe the `x += y` compiler magic.

Why is it provided?

What does it apply to?

Create a collection from another of a different type.

What do Tuples save you?

Name the default mutable and immutable
`Sets/Maps` provided by factory methods.

Describe the behavior of

```
val first, second = someTuple2
```

Describe four ways to make threadsafe sets and maps.

What can newer imports do to older ones?

What is an important difference between
Scala and Java string?

Give a nicer way to widen the static type of a new collection.

Sorted sets and maps are implemented with
which classes?

They are always ...

Which structure do they use?

How does `Predef` choose the default interpretation of `Set`?
