Define serialization.

Give the annotation indicating serializability.

Are annotation automatic getters and setters generally needed? Why?

When are they available?

Give the annotation to indicate that a class or method should **not** be used.

What can annotation arguments be
sometimes?

How do you add an annotation to an
expression?

Give the annotation to indicate concurrently accessed mutable state.

What are the guarantees?

Give the annotation syntax.

Give the annotation to indicate a non-serializable field.

What does it do?

Where are annotations allowed?
