Explain the One-at-a-Time Rule.

How can you circumvent it?

Explain the Explicits-First Rule.

Give a corollary.

Explain the Marking Rule.

Explain the Non-Ambiguity Rule.

Give the most common reason for using view bounds.

Why do implicit conversion methods have names?

What does Scope Rule help with?

Give the most common use of implicit
parameters.

What is the fundamental difference between implicit and 2.8's default parameters?

What's the consequence?

Give some tips for debugging implicits.

Where are implicits tried?

Give the convention for libraries providing implicit conversions.

Where can implicit keyword be used?

Describe the Scope Rule.

Describe the style rule for implicit parameters.

Give the two main uses of implicit receiver conversion.

Return fixed elements along with variable part using `unapplySeq`.
