What is the difference between built-in control structures and curried function control abstractions?

Describe currying and its use.

What is the simplest way to use ScalaTest?

Give another strategy for giving custom
control abstraction a native feel.

Describe higher-order functions and their uses.

Give custom control abstractions a native feel.

Get a reference to a curried function's "second" function.

And its "first" function.

How do you pass method names as values in Scala?

Give an example of a loan pattern.
