Define a new exception.

What is the type of an exception?

What is the type of `raise`?

Give the `try` syntax.

Lookup functions that cannot find their
element raise ...

Functions can reject bad arguments with ...

What is `Failure`?

How is it different from `Invalid_argument`?

Which is typically handled?

If no pattern is matched, what happens?

Describe assertions.

Name the errors resulting from lack of
memory or stack space.

Name some non-typical uses of exceptions.

How can exceptions reduce memory usage?
